

[220 / 319] Database I

Meena Syamkumar
Andy Kuemmel
Cole Nelson

220 Progress

Languages learned

- Python [**P**rogramming Language]
- HTML [**M**arkup Language]
- SQL [**Q**uery Language]

Data storage

- CSV files
- JSON files
- SQL databases

structured query language

Learning Objectives

- Explain how a database is different from a CSV file or a JSON file
- Use SQLite to connect to a database and pandas to query the database
- Write basic queries on a database using SELECT, FROM, WHERE, ORDER BY, and LIMIT

CSV

State	Capital	Population	Area
WI	Madison	5795000	65498
...

Characteristics

- one table
- columns *sometimes* named
- **everything is a string**

SQL Database

capitals

State	Capital
WI	Madison
...	...

populations

State	Population
WI	5795000
...	...

counties

County	Pop	un_emp
Dane	536416	0.02
...

areas

State	Area
WI	65498
...	...

no text allowed

Characteristics

- collection of tables, each named
- columns *always* named
- **types per column (enforced)**

Why use a database?

I. More Structure

Database

A	B	C
text	integer	real
text	integer	real
text	integer	real
text	integer	real

same fields and same
types in every column

CSV

```
A,B,C
string,string,string
string,string,string
string,string,string
string,string,string
```

everything is a string

JSON

```
[{"A":"val", "B":10, "C":3.14},
{"A":"val"},
{"A":"v2", "B": 9, "C":False},
```

types, but...

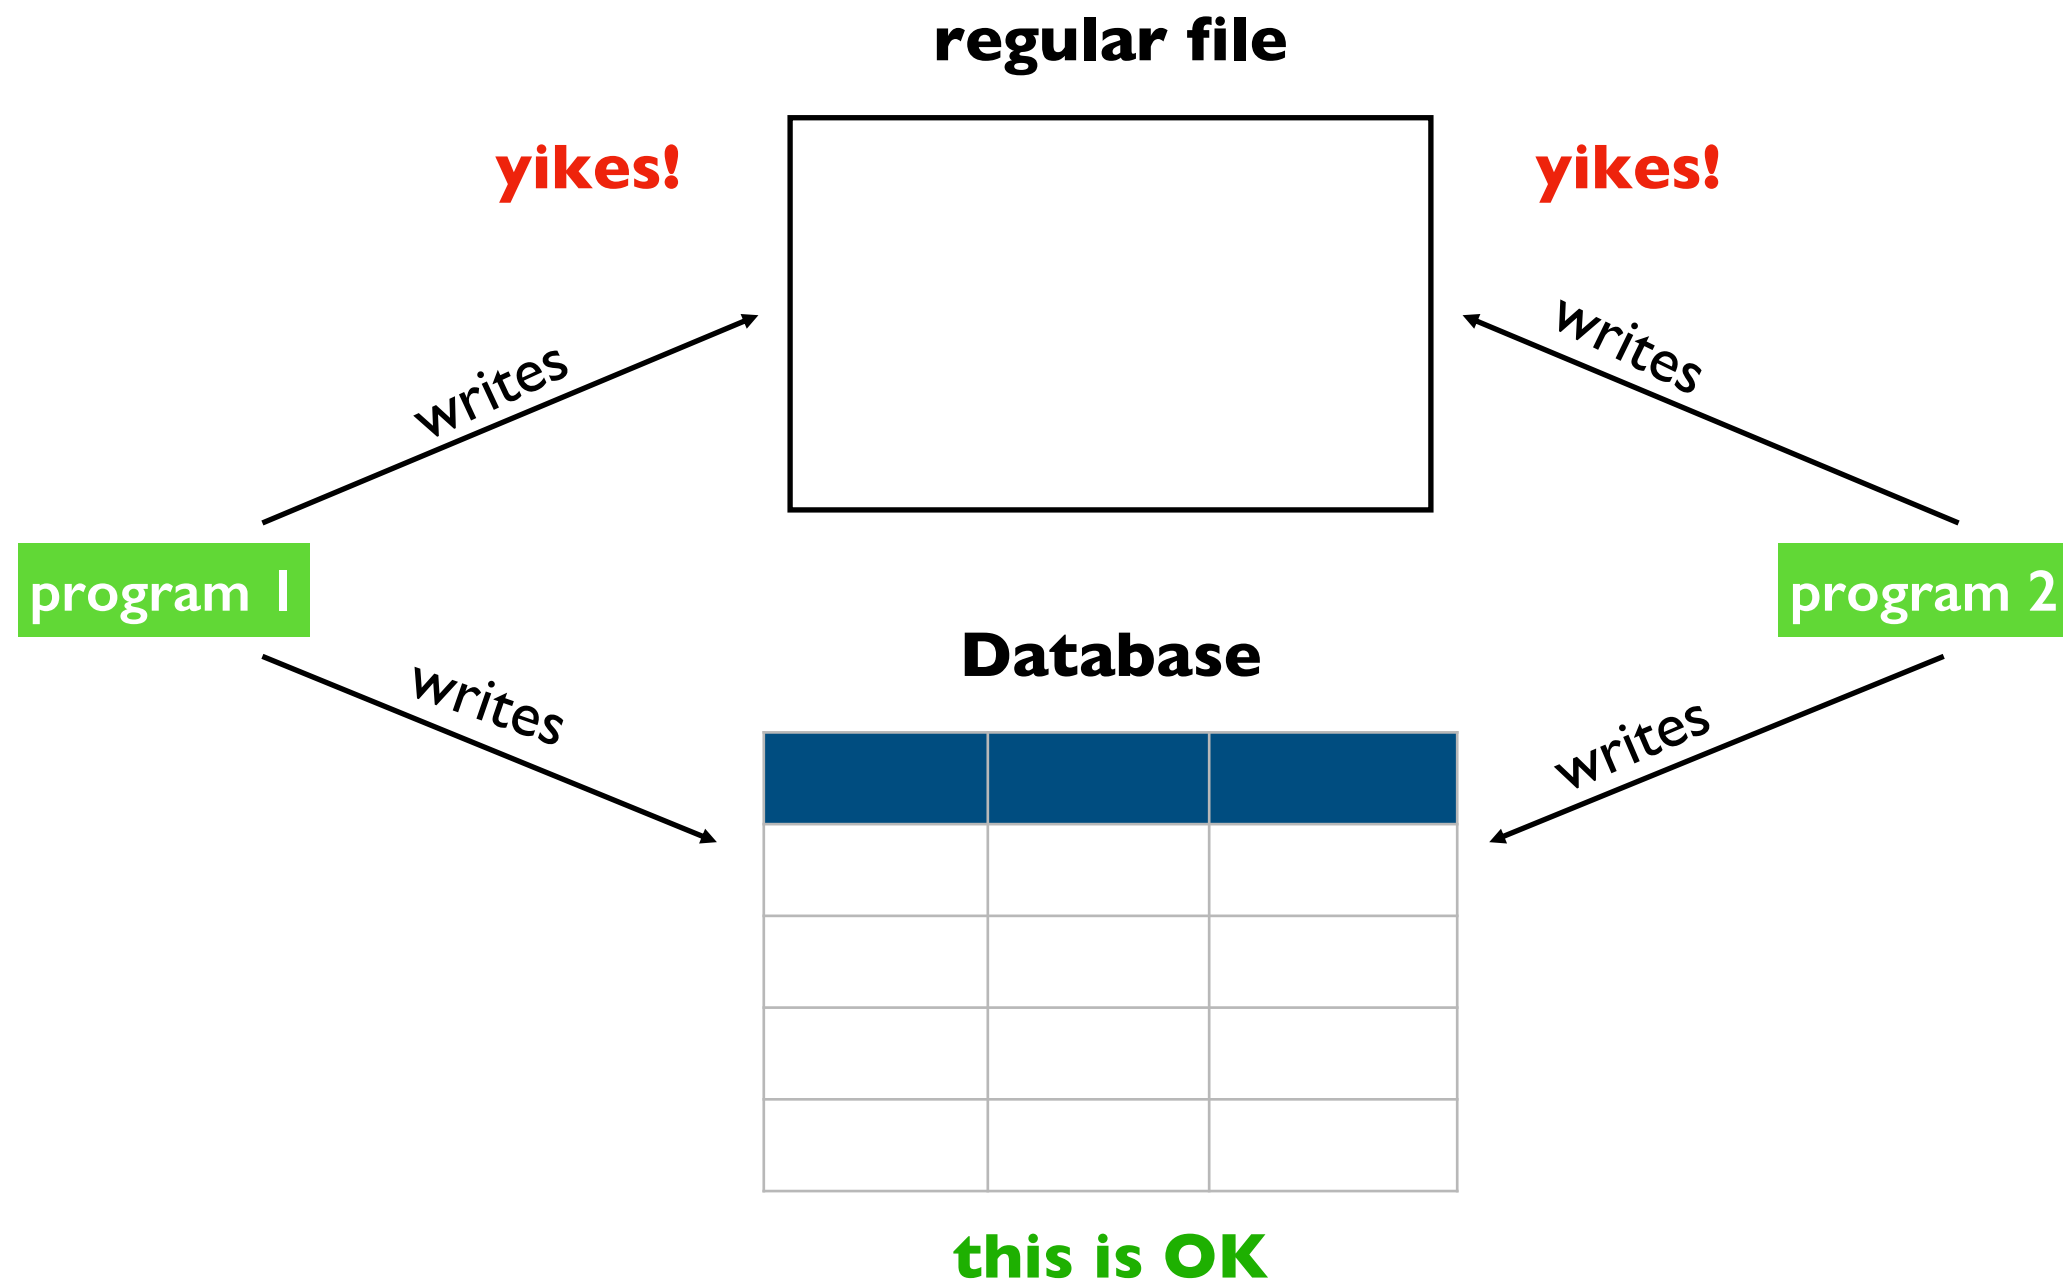

missing values

types may differ across columns

Why use a database?

1. More Structure

2. Sharing

Why use a database?

1. More Structure

2. Sharing

3. Queries

**which actor appeared
in the most movies?**

Why use a database?

1. More Structure

2. Sharing

3. Queries

Why use a database?

1. More Structure

2. Sharing

3. Queries

4. Performance

Let's play a game where we pretend to be a database!

Question 1:

How many people are 23 or younger?

Question 2:

How many people scored 23 or less?

names	age	score
Parker	?	?
Heidy	?	?
Shirly	?	?
Arla	?	?
Bella	?	?
Bill	?	?
Hollis	?	?
Maurita	?	?
Milda	?	?
Pearline	?	?
Teresa	?	?
Ceola	?	?
Milford	?	?
Alisha	?	?
Antonetta	?	?
Ryan	?	?
Karma	?	?
Lashandra	?	?
Breana	?	?
Sara	?	?

Question 1:

How many people are 23 or younger?

Question 2:

How many people scored 23 or less?

Which question took longer to answer? Why?

names	age	score
Parker	26	21
Heidy	22	22
Shirly	27	22
Arla	21	22
Bella	22	22
Bill	28	22
Hollis	26	23
Maurita	22	24
Milda	22	25
Pearline	29	25
Teresa	25	25
Ceola	30	26
Milford	25	26
Alisha	30	27
Antonetta	28	28
Ryan	25	28
Karma	23	28
Lashandra	24	29
Breana	22	30
Sara	28	30

DBs can keep **multiple copies** of the same data

- which organizations to use are **configured** (indexing)
- which copy to use is used is **automatically determined** based on the question being asked

names	age	score
Arla	21	22
Heidy	22	22
Bella	22	22
Maurita	22	24
Milda	22	25
Breana	22	30
Karma	23	28
Lashandra	24	29
Teresa	25	25
Milford	25	26
Ryan	25	28
Parker	26	21
Hollis	26	23
Shirly	27	22
Sara	28	30
Bill	28	22
Antonetta	28	28
Pearline	29	25
Alisha	30	27
Ceola	30	26

copy 1

names	age	score
Parker	26	21
Heidy	22	22
Shirly	27	22
Arla	21	22
Bella	22	22
Bill	28	22
Hollis	26	23
Maurita	22	24
Milda	22	25
Pearline	29	25
Teresa	25	25
Ceola	30	26
Milford	25	26
Alisha	30	27
Antonetta	28	28
Ryan	25	28
Karma	23	28
Lashandra	24	29
Breana	22	30
Sara	28	30

copy 2

Why use a database?

1. More Structure
2. Sharing
3. Queries
4. Performance

Why not use a database?

It's often overkill.

For many situations, a simple JSON or CSV is easier to use.

Outline

Tabular Data: CSVs vs. Databases

Common SQL Databases

Example: Madison bus-route data

SQL: Structured Query Language

Demos

Metro_Transit_Bus_Routes

SQLite Database
File: bus.db

routes
Table

boarding
Table

how do we use this data?

SQLite Database
File: bus.db

**routes
Table**

**boarding
Table**

sqlite3

```
import sqlite3
```

```
conn = sqlite3.connect("file.db")
```

connect for databases is
analogous to **open** for files

database filename

- represented as a string
- will create if doesn't already exist (no "w" necessary)

a **connection object** for
databases is analogous to **file
object** for files

close it at the end

```
conn.close()
```

sqlite3

```
import sqlite3
import pandas as pd
conn = sqlite3.connect("file.db")

df = pd.read_sql("select ???? from ????", conn)

conn.close()
```

ask this question query

```

1 import os, sqlite3
2
3 assert os.path.exists("bus.db")
4 sqlite3.connect("bus.db")
5
6 for sql in pd.read_sql("select sql from sqlite_master", conn)["sql"]:
7     print(sql)
8     print()

```

```
1 pd.read_sql("select * from routes", conn)
```

1092	39	80	43.071895	-89.397341	628.88

You can use any combination of where, order by, and limit.
But whichever you use, they must appear in that order!
